CLOUD SECURITY

Top 3 Nightmares

Andras Cser, Forrester Research

1. How do I maintain compliance and data sovereignty?

The laws and the regulations are constantly changing!

#1 concern for C-Level executives

$1M average cost to remediate a data breach

2. Is my data kept separate from other client’s data, in a multi-tenant environment?

Data getting exposed to third parties is the #1 concern for organizations

Emerging hypervisor vulnerabilities create a security gap

3. Does the cloud provider have strict policies on who can access data?

Gosh! I don’t want a ‘Snowden’ incident with my organization

Privileged Insider are still the Most Dangerous Insiders

55% of C-Level executives believe there will be more data breaches in the coming year

Best Practices for a Good Night’s Sleep

Secure and manage your cloud by making Workload Security more intelligent.

With intelligent Workload Security, you can:

- Meet data sovereignty and data residency requirements with data geo-fencing
- Get instant and continuous visibility of workload across all clouds
- Enforce admin roles to protect and monitor insider threats on public and/or private clouds
- Ensure that data is encrypted and protected automatically
- Enable workloads to self-check security and automatically protect themselves from bad actors
- Enable secure data separation allowing varied security levels of workloads on the same platform
